ABSTRACT: Viktor Ivanovich Ivanov, Dr. of Tech. Sciences, professor of the Leningrad Electrotechnical Institute imeni V. I. Ulyanov, died 24 August 1964. He was born in 1900, was the first teacher of special relay protection of power equipment in the USSR, outlining the principles of the new discipline in a monograph published in 1932. In recent years, Ivanov has concentrated in the development of the teaching of industrial electronics and pulse technology in the Leningrad Institute. [JPRS]

TITLE: A Non-Selective Optico-Acoustic Receiver With a Capacitor Microphone

PERIODICAL: Optika i spektroskopiya, 1961, Vol.10, No.1, pp.127-130

TEXT: A new version of a pneumatic infrared detector with a capacitor microphone is described. The chopped beam passes through the 3 mm window 1 and is absorbed by the aluminum layer deposited on the organic film base located in chamber 2 and fastened to the brass ring 3. The detecting membrane, metallized by antimony or silver and maintained under a tension of 1.6×10^4 dyne/cm, makes contact with the brass ring 4. A perforated brass electrode 5 is placed in the plexiglas ring 6 parallel to the detecting membrane at a distance of 10 to 15 μ from it. The latter, with electrode 5, forms a capacitor microphone with a capacitance of 4 to 6 $\mu\mu F$; it can withstand a polarizing voltage of 5 to 15 V. Slow changes of temperature are compensated by joining the volume in front and behind the membrane by means of a channel 9. The capacitor microphone is

connected to the balanced r-f (320 kc) bridge. The h-f bridge voltage is amplitude-modulated by the interrupted signal and feeds the amplification unit which consists of an r-f amplifier, a detector, an a-f amplifier, a synchronous detector and a d-c indicating instrument. With a 0.15 c amplifier transmission band and a 10 c pulse repetition rate, the rms noise value is 1.2×10^{-10} V. The threshold sensitivity of this detector is 2 to 4 times lower than that of a detector which uses an optical microphone. However, the detector with a capacitor microphone is simpler and lends itself to wider use in cases where the radio flux to be measured is chopped at low frequency. Acknowledgments are made to M.L.Veyngerov who directed this work. The first of the two authors (Pankratov) developed the receiver, the second (Vasil'yev) developed the amplifier. There are 2 figures and 15 references: 9 Soviet and 6 non-Soviet.

(*Ledum palustre*) and Lubricated Condensation Water.

Orig Pub : Tr. Arkhang. lesotekhn. in-ta, 1957, 17, 193-201

Abstract : Research was directed at ascertaining the phytoncidic properties of the essential oil (EO) of *Ledum palustre* L. and of condensed water lubricated with wild Rosemary (*Ledum palustre* water) (L!), containing 0.05 to 0.08 percent of EO obtained from dry leaves, gathered in July and August in the vicinity of Arkhangel'sk. Protistocidic properties of the above described preparations were checked as to their action on *Paramecium caudatum*. These studies have shown that fresh wild Rosemary leaves and leaves dried at room temperature and stored for 7 months both have phytoncidic effects

(PE); EO, LW and Aqueous-oil emulsion obtained from the above leaves also possess PE. It is pointed out that protistotoxic properties in LW rise with the increase of its acidity. PE of water-oil emulsions increases with the rise of the degree of dispersion of EO and its acidity. It has been established that the highest protistotoxic effect is produced by acid-phenolic fraction, while a fraction of liquid neutral components is weaker in its effects. Solid ledol in a dry condition as well as in the form of a aqua-ledolic suspension does not show a noticeable effect of Paramecium caudatum. By the method described, the presence of essential oils and essential oil acids in the composition of wild Rosemary oil has been established. Checking of bactericide properties of LW under clinical conditions clearly proved bactericidal qualities of the preparation against coccus flora and intestinal bacillus which may lead to the possibility of practical use of preparations of the wild Rosemary in medicine and Card : 2/2 the pharmaceutical industry. -- Braytseva.

TITLE: Numerical solution of a boundary problem for the system of nonlinear integro-differential equations of a supersonic boundary layer

SOURCE: Moscow. Universitet. Vy*chislitel'ny* tsentr. Sbornik rabot, no. 2, 1963. 'Chislenny*ye metody* v gazovoy dinamike, 146-161

TOPIC TAGS: boundary value problem, integrodifferential equation, nonlinear equation, supersonic boundary layer, body of revolution, numerical method, computing process scheme, iteration method, variable step net, numerical method convergence, boundary layer, axisymmetric flow, viscous fluid flow

ABSTRACT: A system of equations describing a supersonic boundary layer on a slender body of revolution within an axially symmetric flow of a viscous, heat-conducting gas is rewritten in Dorodnitsyn variables ξ and n , and the boundary conditions under which the system is to be solved are established. The solution of the boundary value

Card 1/3

ACCESSION NR: AT4006714

problem is sought in the form:

$$u = \psi(\xi), \quad i = i(\xi), \quad \xi = \frac{\sqrt{R} \eta}{2M\sqrt{k}}, \quad (1)$$

where u and i are velocity and enthalpy functions of the boundary layer respectively, R is the Reynolds number, and M is the Mach number. After substituting (1) into the system of equations and boundary conditions, the boundary value problem for Volterra's nonlinear integro-differential equation is derived. It is to be solved simultaneously with the cubic equation expressing the condition for the existence of solutions of (1). An iterative difference method is used to solve the problem. The scheme for the difference approximation of the boundary value problem and the iterative process for solving it are described in detail. Peculiarities of difference approximations of the derivatives, integrals, and particular blocks of the calculation process are presented. Problems of selecting given functions, constants, and initial approximations, also their effect on the number of

Cord. 2/3

ACCESSION NR: AT4006714

iterations needed to attain a given accuracy of approximation, are analyzed. In order to test this method, the known Blasius case of a boundary layer was calculated and results compared with ones derived by other numerical methods. A series of particular variants of the problem are calculated by means of the described method, and the results are analyzed. Orig. art. has: 47 formulas and 4 figures.

TOPIC TAGS: boundary value problem, difference method, heat conduction, Stefan problem, nonlinear equation, iteration

ABSTRACT: In a review of studies on the problem, the present paper starts with an investigation of difference methods for the solution of single-phase and two-phase Stefan-type problems for the nonlinear parabolic equation with sufficiently generalized nonlinear boundary conditions. For the numerical solutions to these problems the authors propose the use of implicit difference expressions with the phase front trapped at the difference lattice point and the application of the iteration method. Using certain auxiliary limitations imposed on the problem they show also that the approximate solutions converge to the respective (classical) solutions, and this is viewed as the existence proof of such solutions. The article offers a description of numerous existing difference methods for

S/081/63/000/005/038/075AUTHOR: Ivanov, D., Vasilyev, G., Panaiatov, I. and Borisov, G.TITLE: Synthesis with lithium organic compounds, obtained by replacement
of the labile hydrogen atomPERIODICAL: Referativnyy zhurnal, Khimiya, no. 5, 1963, 261, abstract 5Zh268
(Godishnik Sofiisk. un-ta. Fizmatem. fak., 1957-1958 (1959),
v. 52, no. 3, 1-54)TEXT: In the course of action of RLi (R=alkyl or aryl) on ArCH₂COONa (Ia-
c here and hereafter aAr = C₆H₅, bAr = α -C₁₀H₇, cAr = β -C₁₀H₇) ArCHLiCOONa (II),
is formed which is converted after action of CO₂ and acidification into ArCH
(COOH)₂ (III). By the interaction of II with (C₆H₅)₂CO (IV) there (C₆H₅)C(OH)
CHArCOOH (V) is obtained. The use of lithium alkyls in the place of ArLi leads to a decrease in yield of III and IV. The reaction of RLi with Ia in the absence of substituents in the ortho position may proceed by a different course, with formation of C₆H₅CH₂COR (VI), the interaction of which with II leads to C₆H₅CH₂
CR(OH)CH(C₆H₅)COOH (VIII), by the action of RLi an ArCH₂CN (VIII) ArCHLiCN (IX)

Card 1/5

L 12281-63

Synthesis of lithium organic

S/081/63/000/005/038/075

is obtained which changes into $\text{ArCH}(\text{CN})\text{COOH}$ (X). In reaction of IX with IV $(\text{C}_6\text{H}_5)_2\text{C}(\text{OH})\text{CHARCN}$ (XI) is formed. The interaction of IIa with $\text{Ar}'\text{CH}_2\text{Cl}$ with subsequent hydrolysis leads to $\text{C}_6\text{H}_5\text{CH}_2\text{CHAR.COOH}$ (XII). In the reaction of IIa with unsaturated ketones of the type $\text{Ar}'\text{CH} = \text{CHCO}\text{C}_6\text{H}_5$ (XIII) and $\text{C}_6\text{H}_5\text{CH} - \text{CHOCH} + \text{CHC}_6\text{H}_5$ (XIV) the addition takes place in 1,4 position and after hydrolysis $\text{C}_6\text{H}_5\text{CH}(\text{COOH})\text{CHAR}'\text{CH}_2\text{COC}_6\text{H}_5$ (XV) and $\text{C}_6\text{H}_5\text{CH}(\text{COOH})\text{CH}(\text{C}_6\text{H}_5)\text{CH}_2\text{COCH} = \text{CHC}_6\text{H}_5$ (XVI) are obtained respectively. The addition of the Schiff's bases of $\text{Ar}''\text{N} = \text{CHAR}'$ to IIa leads to $\text{C}_6\text{H}_5\text{CH}(\text{COOH})\text{CHAR}'\text{NAr}''$ (XVII). In the action of I_2 or N-bromosuccinimide on II meso-forms of $\text{ArCH}(\text{COOH})\text{CH}(\text{Ar})\text{COOH}$ are formed. The reactivity of II and IX is comparable to similar Grignard compounds. From 1.2 g of Li, 13.7 g of O-bromotoluene (XVIII) 12.7 g of Ia and 14.6 g of IV in 100 ml of ether Va is obtained, the yield for which is 67%, m.p. 187 - 188° C (from alcohol). Va is also obtained with the use of other RLi (indicated are starting bromide and yield of Va in %): α -C H Br (XIX), 65-70 (with 25% excess of Li and XI the yield is 71%) 1,3,5-(CH_3)₃ $\text{C}_6\text{H}_2\text{Br}$, 72; 1,3-(CH_3)₂ $\text{C}_6\text{H}_2\text{Br}_2$ -4,6, 33. From Ib $\text{C}_6\text{H}_5\text{Br}$, Li and IV, Vb are obtained with 57% yield, m.p. 159-160° C (from alcohol). In the synthesis of Va using RLi maximum yields are observed if R- is a primary radical. Below are given starting halides, solvent and yield of Va in %: n-

Vasil'yev, G., Engineer

TITLE:

Man Will Raise His Wings

PERIODICAL:

Tekhnika molodezni, 1960, No. 8, p. 29

TEXT: The author reports on some models of flying apparatus moved by wings. By means of these apparatus, man wants to attain the power of flight supported by these in the first place by weight. Consider first A. V. Shukov of Tiflis (1908), F. I. Slobodko and M. I. Chetnik (1911), B. I. Chernavskiy, S. A. Taprygin, V. A. Boytsev, D. V. Blinov, and N. G. Poddubnyak (Fig. F. 29), A. Yu. Menatsker, Engineer, A. I. Boldyrev, P. V. Minutin are mentioned. The wings are moved either by muscular force or by means of small engines. Constructions in which the wings move not only up and down but simultaneously describe circles with their ends are very promising. A section was founded at the Tsentral'nyy aeroklub DOSAAF SSSR (Central Aviation Club of the DOSAAF USSR) which deals with the design and construction of "wing airplanes" (helicopters). There is a figure.

TITLE: Radiometric Control of the Stock Line Level in a Blast Furnace (Radiometricheskiy kontrol' urovnya materialov v domennoy pechi)

PERIODICAL: Stal', 1959, Nr 3, pp 204 - 205 (USSR)

ABSTRACT: A description of an experimental radiometric stock level indicator is given. Its operation is based on the irradiation of the working volume of the furnace throat by two radioactive sources (Co^{60} of 500 millicurie each) and measuring of the degree of absorption of the radiation by the burden with counters (enclosed in water-cooled tubes) distributed in vertical rows from the four sides of the throat (Figures 1 and 2). This indicator was installed on a blast furnace at the Dzerzhinskiy Works and its operation was compared with the mechanical stock level indicators. It was found that in general stock level measuring rods indicate a stock level lower than the actual level of the stock in the furnace. The new stock level indicator showed clearly non-uniformity of the burden descent along the periphery of the furnace and the

Card1/2

Radiometric Control of the Stock Line Level in a Blast Furnace SOV/133-59-3-3/32

variability of the position of the maximum rate of the descent along the periphery. The most stable rate of burden descent was found to be at the side of the tapping hole (tuyeres over the tapping holes were of a smaller diameter) and the highest rates of descent were observed from the sides of the slag notches. The radiometric indicator was developed by the Ukrainskiy institut metallov (Ukrainian Institute of Metals) in co-operation with TsNIIChM. It is planned to produce an industrial type of the apparatus with improved recording instruments. There are 2 figures and 2 Soviet references.

TITLE: Shielding properties of certain types of concrete

CITED SOURCE: Sb. Vopr. fiz. zashchity reaktorov. M., Gosatomizdat, 1963, 193-198

TOPIC TAGS: radiation, concrete, neutron, gamma radiation, shielding, shield, radiation shielding, radiation shield, cement

TRANSLATION: Investigations that were conducted showed that heavy concrete gives more effective protection against neutrons and gamma-radiation. The addition of magnesium to the concrete somewhat increases the shielding properties as compared to concrete of Portland cement in the same density. The introduction of Boron compounds into the concrete greatly reduces the flow of thermal neutrons.

Text Data

Coverage: This is a textbook prepared for use with a course in "Blasting" given in technical colleges of the Ministry for the Building Materials Industry in the USSR. The main emphasis is put on blasting in open-cut exploitations. The methods used in underground mining are outlined to a lesser extent. The theory and technology of blasting presented is based mainly on the experiences of the Main Office for Blasting

1/2

Vzryvnyye raboty

ID 265 - I

Works in Industry (Glavvzryvprom), formerly the All-Union
Drilling and Blasting Trust (Soyuzvzryvprom).

This textbook does not treat the properties of explosives,
or drilling, safety measures, and standardization because
all those problems constitute different separate courses.
The problem of blasting is covered in detail with many
empirical formulas.

This is a comprehensive outline of all aspects of blasting
which cannot easily be found in American literature.

*Preparation of carious cavities without drilling STOMATOLOGIJA 1953, 5 (16-20)
(Russian text)

A new treatment of human carious teeth by means of pure chemicals without any use of drills etc. has been tried. A 10% solution of lactic acid was used for etching and softening the carious cavities. After excavation the bottoms of the cavities were dried and neutralized with a bicarbonate solution and then filled in the ordinary way with cements and amalgams. Re-examinations 12-18 months later only showed very few cases of secondary caries and no pulp complications at all.

Teeth

Orig Pub : Stomatologiya, 1956, No 2, 20-26

Abstract : Inflammatory processes of the incisors and the premolars were produced in experiments on 5 dogs. After the pulp was removed, the trepanning cavity was not closed and medical treatment was not administered. In some other cases the root canals were filled. Depending on the projection of the root tops of individual teeth, some reddening and mycedeme of the gums became apparent within the first 1-2 weeks which disappeared when the transition to a chronic state was made. Thrombosis of blood vessels and symptoms of bony tissue

necrosis were not observed in any of the cases (83 teeth). When a chronic inflammatory process was present, the changes within the wall of the alveolus were not limited to the bony tissue proper, but spread constantly to the bone marrow. However, a necrosis of the bony tissue was not observed. An area of a perifocal inflammation and a number of changes of reactive and dystrophic characteristics appear in acute as well as in chronic cases of overcementation. All these changes can not be classified as osteomyelitis, however, since they are not accompanied by necrosis of the bony tissue or other components which are characteristic for this disease.

TITLE: Reactor neutron flux attenuation in polyethylene¹⁹

SOURCE: Atommaya energiya, v. 15, no. 1, 1963, 17-20

TOPIC TAGS: neutron attenuation, polyethylene, polyethylene neutron attenuation, slow neutron, fast neutron, neutron relaxation length, biological shielding, water-water reactor

ABSTRACT: The attenuation of fast and slow neutron fluxes by polyethylene has been investigated experimentally in a water-water research reactor.¹⁹ A polyethylene 680 x 680 x 1000-mm prism consisting of square plates 10 and 20 mm thick was irradiated¹⁹ by placement in a recess in the heavy concrete shielding of the reactor. The slow neutron fluxes were measured by the use of resonant indicators (indium, iodine) and a BF₃ counter. The fast neutron distribution was measured by means of threshold indicators P(n,p), Al(n,p), and Al(n, α) and a scintillation counter with ZnS(Ag). During measurements the plane indicators were inserted into gaps between the polyethylene plates, and

the cylindrical indicators were placed into 20 x 20 x 100-mm holes cut in the plates. The results obtained are shown in Figs. 1 and 2 of the Enclosure, along with theoretical data obtained by the method of moments for a point neutron source. A comparison of neutron relaxation length in polyethylene (density, 0.92 g/cm³) and in water under identical conditions showed that the relaxation length in polyethylene is 12-17% shorter than that in water. "The authors thank the reactor operating personnel and laboratory technicians who took part in the experiment." Orig. art. has: 2 figures and 4 tables.

TITLE: Spectra of reactor fast neutrons passed through polyethylene

SOURCE: Atomnaya energiya, v. 15, no. 1, 1963, 20-22

TOPIC TAGS: fast neutron spectra, polyethylene, reactor shielding

ABSTRACT: Measurements were made of the spectra of fast neutrons after passage through a layer of polyethylene plates (630 x 630 x 10 mm) installed in a recess of the shielding of a water-water reactor. The thickness of the polyethylene layer was increased on the side facing of the spectrometer detectors. The measurements were made by means of a fast-neutron spectrometer with a single detector in which γ -background discrimination was achieved by means of a space charge between the last dynode and anode of the photomultiplier. The fast-neutron spectra were determined from the amplitude distribution of pulses produced by recoil protons in the stilbene crystal of the detector. The spectra were corrected for the effect of secondary neutron scattering in the crystal and for partial leakage of recoil protons from the crystal. The results obtained
